

## TPS65090 Front-End PMU With Switched-Mode Charger for 2 to 3 Cells In Series

### 1 Features

- Wide Input Voltage Charger and Power Path Management:
  - $V_{IN}$  Range From 6 V to 17 V
  - Up to 4-A Output Current on the Power Path
  - Switched-Mode Charger; up to 4-A Maximum Charge Current
  - JEITA Compliant Charging Control
  - Thermal Regulation, Safety Timers
  - 2 Temperature Sense Inputs
- 3 Step-Down Converters:
  - High Efficiency Over a Wide Output Current Range
  - $V_{IN}$  Range From 6 V to 17 V
  - 2 Fixed Output Voltages (5 V and 3.3 V)
    - Up to 5 A of Continuous Output Current
  - 1 Adjustable Output Voltage (From 1 V to 5 V)
    - Up to 4 A of Continuous Output Current
  - Output Voltage Accuracy  $\pm 1\%$
  - Typical 30- $\mu$ A Quiescent Current Per Converter
- 2 Always-On LDOs:
  - 2 Fixed Output Voltages (5 V and 3.3 V)
  - Output Voltage Accuracy  $\pm 1\%$
  - Typical 10- $\mu$ A Quiescent Current per LDO
- 7 Current-Limited Load Switches:
  - One System Voltage Switch With 1-A Current Limit
  - One 5-V Switch With 200-mA Current Limit, Reverse-Voltage Protected
  - One 3.3-V Switch With 3-A Current Limit
  - Four 3.3-V Switches With 1-A Current Limit
  - All Switches Controlled by I<sup>2</sup>C Interface
- I<sup>2</sup>C Interface
  - Standard-Mode (100 kHz) Supported
  - Fast-Mode (400 kHz) Supported
  - Fast-Mode Plus (1000 kHz) Supported
  - High-Speed (3.4 MHz) Supported
- 16-Channel, 10-Bit Analog-to-Digital Converter (ADC)
- Available in a 9-mm x 9-mm, VQFN-100 Package

### 2 Applications

- Battery-Powered Products Using 2 to 3 Li-Cells in Series
- Notebook Computers
- Mobile PCs and Mobile Internet Devices
- Industrial Metering Equipment
- Personal Medical Products

### 3 Description

The TPS65090A device is a single-chip power management IC for portable applications consisting of a battery charger with power path management for a dual or triple Li-Ion or Li-Polymer cell battery pack. The charger can be directly connected to an external wall adapter. Three highly efficient step-down converters are targeted for providing a fixed 5-V system voltage, a fixed 3.3-V system voltage, and an adjustable voltage rail. The step-down converters enter a low power mode at light load for maximum efficiency across the widest possible range of load currents. The step-down converters allow the use of small inductors and capacitors to achieve a small solution size. The TPS65090A also integrates two general-purpose always-on LDOs for powering circuit blocks which control the system while shut down. Each LDO operates with an input voltage range from 6 V to 17 V, allowing the LDOs to be supplied from the wall adapter or directly from the main battery pack.

Seven load switches are built into the device. These load switches can be used to control the power supply individually for certain circuit blocks in the application circuit. The current flowing through the load switches, as well as the output current of the step-down converters, the input current from the AC adapter and the charge current is monitored and can be read out using the digital interface.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS65090A	VQFN-MR (100)	9.00 mm x 9.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision A (July 2013) to Revision B</b>	<b>Page</b>
• Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	<b>1</b>

<b>Changes from Original (January 2013) to Revision A</b>	<b>Page</b>
• Added Differential Voltage spec condition "between CBC and LC", –0.3 MIN and 7 MAX .....	<b>6</b>
• Changed text in ALWAYS ON LDOs and POWER PATH CONTROL sections for clarification .....	<b>27</b>
• Changed text in CHARGER section for clarification .....	<b>29</b>
• Added INTERRUPTS section for clarification .....	<b>33</b>
• Added text to REVERSE VOLTAGE PROTECTION section for clarification .....	<b>53</b>
• Changed graph title from "ADAPTER INPUT POWER UP AND POWER DOWN" to "SUPPLEMENT MODE OPERATION" .....	<b>56</b>
• Added text to THERMAL INFORMATION section for clarification .....	<b>61</b>

## 5 Pin Configuration and Functions

**RVN Package  
100-Pin VQFN-MR  
Top View**

**Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
<b>POWER PATH CONTROL</b>			
ACG	A51	O	Gate connection for AC adapter input switches
ACN	A50	I	Shunt resistor sense connection for input current sensing
ACP	B47	I	Shunt resistor sense connection for input current sensing
ACS	B48	I	Source connection for AC adapter input switches
BATG	A2	O	Gate connection for the battery switch
VAC	A13	I	AC adapter supply input for charger control
VACS	A14	I	AC adapter sense input for the charger
<b>CHARGER</b>			
CBC	B2	I	Bootstrap capacitor connection for charger step-down converter
ENC	A41	I	Enable input for charger (1: enabled, 0: disabled), must be connected to a valid logic signal
FBC	A52	I	Voltage feedback input for charger step-down converter. Must be connected to an external feedback divider to program charge voltage.
LC	A5, B4, B5	O	Inductor connection for switched-mode battery charger step-down converter
PGND	A6, B6	—	Power Ground
SRN	B1	I	Shunt resistor connection for battery charge current sensing
SRP	A1	I	Shunt resistor connection for battery charge current sensing
STAT	B13	O	Charge status pin, open-drain (charge in progress, charge complete, sleep mode, fault)
TS1	A24	I	Temperature sensor input for temperature sensor 1
TS2	B23	I	Temperature sensor input for temperature sensor 2
VACG	A39	O	VAC good pin, open drain (1, high impedance : voltage good; 0 : voltage not available)
VBAT	A15	I	Battery sense connection

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
VBATG	A38	O	VBAT good pin, open drain (1, high impedance : voltage good; 0 : voltage not available), pullup voltage should not be higher than voltage connected to
VREFT	A25	I	Reference voltage output for temperature measurements
VSYS	A3, A4, B3	I	Switched-mode battery charger step-down converter supply voltage
VSYSG	B36	O	VSYS good pin, open drain (1, high impedance : voltage good; 0 : voltage not available)
<b>DCDC1</b>			
CB1	B44	I	Bootstrap capacitor connection for DCDC1
EN1	B38	I	Enable input for DCDC1 (1: enabled, 0: disabled), must be connected to a valid logic signal
FB1	B37	I	Output voltage sense input for DCDC1
L1	A45, B41, B42	O	Inductor connection for DCDC1 step-down converter
PGND1	A43, A44, B40	—	Power Ground
VDCDC1	A48	I	Output voltage connection of DCDC1
VSYS1	A46, A47, B43	I	Supply voltage input for DCDC1 step-down converter
<b>DCDC2</b>			
CB2	B17	I	Bootstrap capacitor connection for DCDC2
EN2	A42	I	Enable input for DCDC2 (1: enabled, 0: disabled), must be connected to a valid logic signal
FB2	B24	I	Output voltage sense input for DCDC2
L2	A21, B19, B20	O	Inductor connection for DCDC2 step-down converter
PGND2	A22, A23, B21, B22	—	Power Ground
VDCDC2	A18	I	Output voltage connection of DCDC2
VSYS2	A19, A20, B18	I	Supply voltage input for DCDC2 step-down converter
<b>DCDC3</b>			
CB3	A12	I	Bootstrap capacitor connection for DCDC3
EN3	A26	I	Enable input for DCDC3 (1: enabled, 0: disabled), must be connected to a valid logic signal
FB3	B14	I	Output voltage feedback input for DCDC3, a resistive feedback divider must be connected
L3	A9, B8, B9	O	Inductor connection for DCDC3 step-down converter
PGND3	A7, A8, B7	—	Power Ground
VDCDC3	A16	I	Output voltage sense input for DCDC3
VSYS3	A10, A11, B10, B11	I	Supply voltage input for DCDC3 step-down converter
<b>LDO1</b>			
FB_L1	B46	I	Output voltage sense input for LDO1
VLDO1	B45	O	Output of the LDO1 linear regulator
VSYS_L1	A49	I	Supply voltage input for LDO1 linear regulator
<b>LDO2</b>			
FB_L2	B15	I	Output voltage sense input for LDO2
VLDO2	B16	O	Output of the LDO2 linear regulator
VSYS_L2	A17	I	Supply voltage input for LDO2 linear regulator
<b>FET1</b>			
INFET1	B28	I	Supply voltage input for load switch FET1, connect to GND, if not used
VFET1	A30	O	Output of load switch FET1, leave unconnected if not used
<b>FET2</b>			
INFET2	B29	I	Supply voltage input for load switch FET2, connect to GND, if not used

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
VFET2	A31	O	Output of load switch FET2, leave unconnected if not used
<b>FET3</b>			
INFET3	A34, B31	I	Supply voltage input for load switch FET3, connect to GND, if not used
VFET3	A32, B30	O	Output of load switch FET3, leave unconnected if not used
<b>FET4</b>			
INFET4	B34	I	Supply voltage input for load switch FET4, connect to GND, if not used
VFET4	A37	O	Output of load switch FET4, leave unconnected if not used
<b>FET5</b>			
INFET5	B33	I	Supply voltage input for load switch FET5, connect to GND, if not used
VFET5	A36	O	Output of load switch FET5, leave unconnected if not used
<b>FET6</b>			
INFET6	B32	I	Supply voltage input for load switch FET6, connect to GND, if not used
VFET6	A35	O	Output of load switch FET6, leave unconnected if not used
<b>FET7</b>			
INFET7	B27	I	Supply voltage input for load switch FET7, connect to GND, if not used
VFET7	A29	O	Output of load switch FET7, leave unconnected if not used
<b>DIGITAL INTERFACE/CONTROL</b>			
AGND	A33	—	Analog ground
GND	A40	—	Logic ground
IRQ	B12	O	Interrupt output, open drain, (1, high impedance : no interrupt; 0 : interrupt) details on events available through I <sup>2</sup> C
PGND	C1, C2, C3, C4	—	Internally connected to PowerPAD™
PowerPAD		—	Must be soldered to achieve appropriate power dissipation. Must be connected to PGND.
SCL	B25	I/O	Clock input for the I <sup>2</sup> C interface
SDA	A27	I/O	Data line for the I <sup>2</sup> C interface
VCTRL	B39	O	Internal control supply decoupling capacitor connection
VREF	B35	O	Reference voltage decoupling capacitor connection
VREFADC	B26	O	ADC reference voltage decoupling capacitor connection

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
<b>POWER PATH CONTROL</b>				
Voltage <sup>(2)</sup>	VAC, VACS	-0.3	30	V
	ACP, ACN, ACS, BATG	-0.3	20	
Differential Voltage	between ACP and ACN	-0.5	0.5	V
	between ACG and ACS	-0.3	7	
<b>CHARGER</b>				
Voltage <sup>(2)</sup>	VSYS, VBAT, LC, SRP, SRN, STAT	-0.3	20	V
	FBC, TS1, TS2, VREFT	-0.3	7	
	ENC	-0.3	3.6	
Differential Voltage	between SRP and SRN	-0.5	0.5	V
	between CBC and LC	-0.3	7	
<b>DCDC1</b>				
Voltage <sup>(2)</sup>	VSYS1, L1	-0.3	20	V
	FB1, VDCDC1	-0.3	7	
	EN1	-0.3	3.6	
Differential Voltage	between CB1 and L1	-0.3	7	V
<b>DCDC2</b>				
Voltage <sup>(2)</sup>	VSYS2, L2	-0.3	20	V
	FB2, VDCDC2	-0.3	3.6	
	EN2	-0.3	3.6	
Differential Voltage	between CB2 and L2	-0.3	7	V
<b>DCDC3</b>				
Voltage <sup>(2)</sup>	VSYS3, L3	-0.3	20	V
	FB3, VDCDC3	-0.3	7	
	EN3	-0.3	3.6	
Differential Voltage	between CB3 and L3	-0.3	7	V
<b>LDO1</b>				
Voltage <sup>(2)</sup>	VSYS_L1	-0.3	20	V
	VLDO1, FB_L1	-0.3	7	
<b>LDO2</b>				
Voltage <sup>(2)</sup>	VSYS_L2	-0.3	20	V
	VLDO2, FB_L2	-0.3	3.6	
<b>FET1</b>				
Voltage <sup>(2)</sup>	INFET1, VFET1	-0.3	20	V
<b>FET2</b>				
Voltage <sup>(2)</sup>	INFET2, VFET2	-0.3	6	V
<b>FET3</b>				
Voltage <sup>(2)</sup>	INFET3, VFET3	-0.3	6	V
<b>FET4</b>				
Voltage <sup>(2)</sup>	INFET4, VFET4	-0.3	6	V

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltages are with respect to network ground terminal.

## Absolute Maximum Ratings (continued)

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
<b>FET5</b>				
Voltage <sup>(2)</sup>	INFET5, VFET5	-0.3	6	V
<b>FET6</b>				
Voltage <sup>(2)</sup>	INFET6, VFET6	-0.3	6	V
<b>FET7</b>				
Voltage <sup>(2)</sup>	INFET7, VFET7	-0.3	6	V
<b>DIGITAL INTERFACE/CONTROL</b>				
Voltage <sup>(2)</sup>	SDAT, SCLK, IRQ, VCTRL, VCTRL2, VACG, VSYSG, VBATG	-0.3	7	V
	VREFADC, VREF	-0.3	3.6	
<b>GENERAL</b>				
Temperature	Operating junction, T <sub>J</sub>	-40	150	°C
	Storage temperature, T <sub>stg</sub>	-65	150	

## 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
<b>POWER PATH CONTROL</b>					
Supply voltage at VAC		6		17	V
Differential voltage between ACP and ACN		-0.2		0.2	V
<b>CHARGER</b>					
Supply voltage at VSYSC, VBAT		6		17	V
Differential voltage between SRP and SRN		-0.2		0.2	V
<b>DCDC1</b>					
Supply voltage at VSYS1		6		17	V
<b>DCDC2</b>					
Supply voltage at VSYS2		6		17	V
<b>DCDC3</b>					
Supply voltage at VSYS3		6		17	V
<b>LDO1</b>					
Supply voltage at VSYS_L1		6		17	V
<b>LDO2</b>					
Supply voltage at VSYS_L2		6		17	V
<b>FET1</b>					
Supply voltage at INFET1		5		17	V
<b>FET2</b>					
Supply voltage at INFET2		4.5		5.5	V
<b>FET3</b>					
Supply voltage at INFET3		3		5.5	V
<b>FET4</b>					
Supply voltage at INFET4		3		5.5	V

**Recommended Operating Conditions (continued)**

	MIN	NOM	MAX	UNIT
<b>FET5</b>				
Supply voltage at INFET5	3		5.5	V
<b>FET6</b>				
Supply voltage at INFET6	3		5.5	V
<b>FET7</b>				
Supply voltage at INFET7	3		5.5	V
<b>CONTROL</b>				
Supply voltage at VCTRL2	3		5.5	V
<b>GENERAL</b>				
Operating free-air temperature, $T_A$	-40		85	°C
Operating junction temperature, $T_J$	-40		125	°C

**6.4 Thermal Information**

THERMAL METRIC <sup>(1)</sup>		TPS65090A	UNIT
		RVN [VQFN-MR]	
		100 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	24.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case(top) thermal resistance	5.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	3.9	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.1	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	3.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case(bottom) thermal resistance	0.1	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

**6.5 Electrical Characteristics - Power Path Control**

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
VAC overvoltage disconnect		17	17.6	18.2	V
VAC overvoltage hysteresis			550		mV
VAC undervoltage lockout	$V_{AC}$ voltage decreasing	5	5.5	6	V
VAC undervoltage lockout hysteresis			550		mV
Maximum input DPM current programming range		1000		4000	mA
( $V_{ACP} - V_{ACN}$ ) voltage to maximum input DPM current gain			100		A / V
Input DPM current regulation	$V_{ACP} - V_{ACN}$ , IACSET = 0	40	44	48	mV
	$V_{ACP} - V_{ACN}$ , IACSET = 1	36	40	44	mV
Maximum battery discharge current comparator threshold	$V_{BAT} - V_{SRN}$ , IBATSET = 0, $T_A = 25^\circ\text{C}$	17.5	20	21	mV
	$V_{BAT} - V_{SRN}$ , IBATSET = 1, $T_A = 25^\circ\text{C}$	15	17.5	18.5	mV
VACS input impedance			1000		kΩ
VAC input impedance			25		kΩ
Gate drive current on ACG		12			μA
Gate drive current on BATG	Turnon	500			μA
Gate drive current on BATG	Turnoff	25			mA
BATG turnoff delay time after adapter is detected			30		ms

## Electrical Characteristics - Power Path Control (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Quiescent current into VAC		Charging enabled, $V_{AC} = 11.5\text{ V}$		2.5	5	mA
		Charging disabled, $V_{AC} = 11.5\text{ V}$		1	1.5	mA
Leakage current into ACP and ACN		Charging disabled			80	$\mu\text{A}$
$V_{SUPPL}$	Supplement threshold to turn on battery switch	$V_{SRN} - V_{ACN}$ rising	13	45	84	mV
$V_{SUPPL\_HYS}$	Supplement mode hysteresis to turn off battery switch	$V_{SRN} - V_{ACN}$ falling		20		mV
$I_{ACRC}$	Reverse adapter current threshold	$V_{ACN} - V_{ACP}$ rising		45		mV
$V_{SLEEP}$	SLEEP mode threshold	$V_{AC} - V_{SRN}$ falling	20	90	150	mV
$V_{SLEEP\_HYS}$	SLEEP mode hysteresis	$V_{AC} - V_{SRN}$ rising		200		mV

## 6.6 Electrical Characteristics - Charger

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>CHARGER - POWER</b>						
$V_{FBC}$	Charger feedback voltage	VSET = 00, default for $T_{01}$ and $T_{40}$	1.98	2	2.02	V
		VSET = 01, default for $T_{12}$	2.03	2.05	2.07	
		VSET = 10, default for $T_{34}$	2.055	2.075	2.095	
		VSET = 11, default for $T_{23}$	2.08	2.1	2.12	
	Leakage current into FBC				0.1	$\mu\text{A}$
$V_{FBCR}$	Charger feedback voltage for automatic charge restart	VSET = 00, ENRECG = 1	1.925	1.950	1.975	V
		VSET = 01, ENRECG = 1	1.975	2	2.025	
		VSET = 10, ENRECG = 1	2	2.025	2.05	
		VSET = 11, ENRECG = 1	2.025	2.05	2.075	
$I_{CHARGE}$	Maximum charge current programming		1000		4000	mA
	$(V_{SRP} - V_{SRN})$ voltage to maximum charge current gain			100		A / V
$I^2C$	programmable charge current	ISET = 000		0%		
		ISET = 001		25%		
		ISET = 010		37.5%		
		ISET = 011, default for $T_{12}$ and $T_{34}$ battery temperature range		50%		
		ISET = 100		62.5%		
		ISET = 101		75%		
		ISET = 110		87.5%		
		ISET = 111, default for $T_{23}$ battery temperature range		100%		
	Charge current sense regulation voltage	$V_{SRP} - V_{SRN} = 40\text{ mV}$ typical, $T_J < 100\text{ }^\circ\text{C}$	38.5	40	42.5	mV
		$V_{SRP} - V_{SRN} = 20\text{ mV}$ typical, $T_J < 100\text{ }^\circ\text{C}$	18.5	20	22	
		$V_{SRP} - V_{SRN} = 4\text{ mV}$ typical, $T_J < 100\text{ }^\circ\text{C}$	2.3	4	5.9	
	Minimum programmable charge current			100		mA
	Precharge current			0.1 *		$I_{CHARGE}$
	Termination current			0.1 *		$I_{CHARGE}$
	Leakage current into SRN and SRP	$V_{BAT} < 12\text{ V}$			45	$\mu\text{A}$

## Electrical Characteristics - Charger (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Switching frequency			1360	1600	1840	kHz
R <sub>DSON</sub>	High-side switch ON-resistance			25		mΩ
R <sub>DSON</sub>	Low-side switch ON-resistance			60		mΩ
<b>CHARGER - CONTROL</b>						
Precharge timer			1600	1800	2000	s
Fast-charge safety timer programming			2		10	h
Fast-charge safety timer accuracy					10%	
I <sup>2</sup> C programmable values for fast-charge safety timer	FASTTIME = 000, default setting			2		h
	FASTTIME = 001			3		
	FASTTIME = 010			4		
	FASTTIME = 011			5		
	FASTTIME = 100			6		
	FASTTIME = 101			7		
	FASTTIME = 110			8		
	FASTTIME = 111			10		
Battery detection discharge timer				1		s
Battery detection discharge current			5		20	mA
Battery detection discharge current after timer fault				2		mA
V <sub>FBCL</sub>	Battery detection discharge feedback voltage threshold for battery OK		1.43	1.45	1.47	V
Battery feedback voltage threshold for precharge to fast-charge transition			1.43	1.45	1.47	V
Battery detection charge timer				0.5		s
Battery detection charge current sense regulation voltage		V <sub>SRP</sub> - V <sub>SRN</sub> = 2 mV typical, T <sub>J</sub> < 100 °C	0.5	2	3.8	mV
Battery detection charge feedback voltage threshold for battery OK	VSET = 00		1.925	1.95	1.975	V
	VSET = 01		1.975	2	2.025	
	VSET = 10		2	2.025	2.05	
	VSET = 11		2.025	2.05	2.075	
Minimum battery feedback voltage for battery good detection		Voltage at FBC increasing	1.44	1.5	1.54	V
Maximum battery feedback voltage for battery good detection		Voltage at FBC increasing	2.18	2.25	2.28	V
Battery cell temperature measurement, ratio of V <sub>TS1,2</sub> compared to V <sub>REFTS</sub> , I <sup>2</sup> C programming option for T <sub>1</sub>		Sensor temperature is -10°C, T <sub>SET</sub> = 000	71.9%	72.4%	72.9%	
Voltage ratio threshold hysteresis		Sensor temperature is -10°C, voltage decreasing		0.2%		
T <sub>1</sub>	Battery cell temperature measurement, ratio of V <sub>TS1,2</sub> compared to V <sub>REFTS</sub>	Default value, Sensor temperature is 0°C, T <sub>SET</sub> = 001	70.4%	71%	71.5%	
	Voltage ratio threshold hysteresis	Sensor temperature is 0°C, voltage decreasing		0.2%		
T <sub>2</sub>	Battery cell temperature measurement, ratio of V <sub>TS1,2</sub> compared to V <sub>REFTS</sub>	Default value, Sensor temperature is 10°C, T <sub>SET</sub> = 010	68.1%	68.7%	69.2%	
	Voltage ratio threshold hysteresis	Sensor temperature is 10°C, voltage decreasing		0.4%		
Battery cell temperature measurement, ratio of V <sub>TS1,2</sub> compared to V <sub>REFTS</sub> , I <sup>2</sup> C programming option for T <sub>2</sub>		Sensor temperature is 15°C, T <sub>SET</sub> = 011	67%	67.4%	67.9%	

## Electrical Characteristics - Charger (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Voltage ratio threshold hysteresis		Sensor temperature is 15°C, voltage decreasing		0.4%		
Battery cell temperature measurement, ratio of $V_{TS1,2}$ compared to $V_{REFTS}$ , I <sup>2</sup> C programming option for T <sub>3</sub>		Sensor temperature is 40°C, T_SET = 100	59.3%	59.7%	60.1%	
Voltage ratio threshold hysteresis		Sensor temperature is 40°C, voltage increasing		0.9%		
T <sub>3</sub>	Battery cell temperature measurement, ratio of $V_{TS1,2}$ compared to $V_{REFTS}$	Default value, Sensor temperature is 45°C, T_SET = 101	57.1%	57.6%	57.9%	
Voltage ratio threshold hysteresis		Sensor temperature is 45°C, voltage increasing		0.9%		
Battery cell temperature measurement, ratio of $V_{TS1,2}$ compared to $V_{REFTS}$ , I <sup>2</sup> C programming option for T <sub>3</sub> or T <sub>4</sub>		Sensor temperature is 50°C, T_SET = 110	54.7%	55.2%	55.8%	
Voltage ratio threshold hysteresis		Sensor temperature is 50°C, voltage increasing		1.1%		
T <sub>4</sub>	Battery cell temperature measurement, ratio of $V_{TS1,2}$ compared to $V_{REFTS}$	Default value, Sensor temperature is 60°C, T_SET = 111	49.6%	50.1%	50.5%	
Voltage ratio threshold hysteresis		Sensor temperature is 60°C, voltage increasing		1.1%		
Output voltage at VREFT		Internally connected to VLDO2		3.3		V
Output impedance of VREFT				4		kΩ
Quiescent current into VBAT		Charging active			25	μA
Quiescent current into VBAT		Charging suspended			150	μA
V <sub>IL</sub>	ENC input low voltage				0.4	V
V <sub>IH</sub>	ENC input high voltage		1.2			V
ENC input current		Clamped on GND or 3.3V		0.01	0.1	μA
Charge current derating starting temperature		Junction temperature increasing		100		°C
Charge current derating starting voltage		V <sub>SYSC</sub> decreasing	6.7	7.3	7.6	V
Overtemperature protection			125	140	150	°C
Overtemperature hysteresis				20		°C

## 6.7 Electrical Characteristics - DC-DC Converters

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>DCDC1 - POWER</b>						
Output voltage		Power save mode disabled	5	5.05	5.125	V
Switch valley current limit		T <sub>A</sub> = 25°C	5500			mA
High-side switch ON-resistance				20		mΩ
Low-side switch ON-resistance				20		mΩ
Maximum line regulation				0.5%		
Maximum load regulation				0.5%		
Output auto-discharge resistance				300	400	Ω
FB1 input impedance		V <sub>EN1</sub> = 1		1		MΩ
Shutdown current into V <sub>SY1</sub>		V <sub>SY1</sub> = 7.2 V, EN1 = 0			1	μA
<b>DCDC1 - CONTROL</b>						
V <sub>IL</sub>	EN1 input low voltage				0.4	V
V <sub>IH</sub>	EN1 input high voltage		1.2			V

## Electrical Characteristics - DC-DC Converters (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
	EN1 input current	Clamped on GND or 3.3 V		0.01	0.1	μA
	Overtemperature protection			140		°C
	Overtemperature hysteresis			20		°C
<b>DCDC2 - POWER</b>						
	Output voltage	Power save mode disabled	3.3	3.333	3.383	V
	Switch valley current limit	T <sub>A</sub> = 25°C	5500			mA
	High-side switch ON-resistance			20		mΩ
	Low-side switch ON-resistance			20		mΩ
	Maximum line regulation			0.5%		
	Maximum load regulation			0.5%		
	Output auto-discharge resistance			300	400	Ω
	FB2 input impedance	V <sub>EN2</sub> = 1		1		MΩ
	Shutdown current into V <sub>SYS2</sub>	V <sub>SYS2</sub> = 7.2 V, EN2 = 0			1	μA
<b>DCDC2 - CONTROL</b>						
V <sub>IL</sub>	EN2 input low voltage				0.4	V
V <sub>IH</sub>	EN2 input high voltage		1.2			V
	EN2 input current	Clamped on GND or 3.3 V		0.01	0.1	μA
	Overtemperature protection			140		°C
	Overtemperature hysteresis			20		°C
<b>DCDC3 - POWER</b>						
	Feedback voltage		792	800	808	mV
	Switch valley current limit	T <sub>A</sub> = 25°C	4200			mA
	High-side switch ON-resistance			20		mΩ
	Low-side switch ON-resistance			20		mΩ
	Maximum line regulation			0.5%		
	Maximum load regulation			0.5%		
	Output auto-discharge resistance			300	400	Ω
	Leakage current into FB3				0.1	μA
	Shutdown current into V <sub>SYS3</sub>	V <sub>SYS3</sub> = 7.2 V, EN3 = 0			1	μA
<b>DCDC3 - CONTROL</b>						
V <sub>IL</sub>	EN3 input low voltage				0.4	V
V <sub>IH</sub>	EN3 input high voltage		1.2			V
	EN3 input current	Clamped on GND or 3.3 V		0.01	0.1	μA
	Overtemperature protection			140		°C
	Overtemperature hysteresis			20		°C

## 6.8 Electrical Characteristics - Linear Regulators

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>LDO1</b>					
Output voltage	$I_{OUTLDO1} = 1 \text{ mA}$	4.90	4.95	5	V
LDO1 current limit	$T_A = 25^\circ\text{C}$	30	50	120	mA
LDO1 maximum output current	DCDC1 active (bypass switch turned on), $V_{SYS} = 7.5 \text{ V}$		120		mA
Maximum line regulation			0.5%		
Maximum load regulation			0.5%		
FB_L1 input impedance			1		MΩ
Quiescent current into VSYS_L1 and VSYS_L2	DCDC1 and DCDC2 are enabled			35	μA
Overtemperature protection			140		°C
Overtemperature hysteresis			20		°C
<b>LDO2</b>					
Output voltage	$I_{OUTLDO2} = 1 \text{ mA}$	3.233	3.267	3.3	V
LDO2 current limit	$T_A = 25^\circ\text{C}$	30	50	120	mA
LDO2 maximum output current	DCDC2 active (bypass switch turned on), $V_{SYS} = 7.5 \text{ V}$		120		mA
Maximum line regulation			0.5%		
Maximum load regulation			0.5%		
FB_L2 input impedance			1		MΩ
Quiescent current into VSYS_L2 and VSYS_L1	DCDC1 and DCDC2 are enabled			35	μA
Overtemperature protection			140		°C
Overtemperature hysteresis			20		°C

## 6.9 Electrical Characteristics - Load Switches

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>FET1</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	1000		1200	mA
Switch ON-resistance				120	mΩ
Output auto-discharge resistance			800		Ω
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / μs
Switch current limit - time-out	Multiplier set to 1, WTFET1 = 00	200		250	μs
Switch current limit - time-out	Multiplier set to 4, WTFET1 = 01	800		1000	μs
Switch current limit - time-out	Multiplier set to 8, WTFET1 = 10	1600		2000	μs
Switch current limit - time-out	Multiplier set to 16, WTFET1 = 11	3200		4000	μs
Leakage current into INFET1	FET1 disabled, $V_{FET1} = 0 \text{ V}$		1		μA
<b>FET2</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	200		240	mA
Switch ON-resistance				500	mΩ
Output auto-discharge resistance			300		Ω
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / μs
Switch current limit - time-out	Multiplier set to 1, WTFET2 = 00	200		250	μs
Switch current limit - time-out	Multiplier set to 4, WTFET2 = 01	800		1000	μs
Switch current limit - time-out	Multiplier set to 8, WTFET2 = 10	1600		2000	μs
Switch current limit - time-out	Multiplier set to 16, WTFET2 = 11	3200		4000	μs

## Electrical Characteristics - Load Switches (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Shutdown current into INFET2	FET2 disabled, $V_{FET2} = 0\text{ V}$		5		$\mu\text{A}$
Reverse leakage current	FET disabled, $V_{FET2} > \text{INFET2}$		10		$\mu\text{A}$
<b>FET3</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	3000		3600	mA
Switch ON-resistance				45	m $\Omega$
Output auto-discharge resistance			300		$\Omega$
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / $\mu\text{s}$
Switch current limit - time-out	Multiplier set to 1, $\text{WTFET3} = 00$	200		250	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 4, $\text{WTFET3} = 01$	800		1000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 8, $\text{WTFET3} = 10$	1600		2000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 16, $\text{WTFET3} = 11$	3200		4000	$\mu\text{s}$
Leakage current into INFET3	FET3 disabled, $V_{FET3} = 0\text{ V}$		3		$\mu\text{A}$
<b>FET4</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	1000		1200	mA
Switch ON-resistance				80	m $\Omega$
Output auto-discharge resistance			300		$\Omega$
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / $\mu\text{s}$
Switch current limit - time-out	Multiplier set to 1, $\text{WTFET4} = 00$	200		250	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 4, $\text{WTFET4} = 01$	800		1000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 8, $\text{WTFET4} = 10$	1600		2000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 16, $\text{WTFET4} = 11$	3200		4000	$\mu\text{s}$
Leakage current into INFET4	FET4 disabled, $V_{FET4} = 0\text{ V}$		1		$\mu\text{A}$
<b>FET5</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	1000		1200	mA
Switch ON-resistance				80	m $\Omega$
Output auto-discharge resistance			300		$\Omega$
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / $\mu\text{s}$
Switch current limit - time-out	Multiplier set to 1, $\text{WTFET5} = 00$	200		250	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 4, $\text{WTFET5} = 01$	800		1000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 8, $\text{WTFET5} = 10$	1600		2000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 16, $\text{WTFET5} = 11$	3200		4000	$\mu\text{s}$
Leakage current into INFET5	FET5 disabled, $V_{FET5} = 0\text{ V}$		1		$\mu\text{A}$
<b>FET6</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	1000		1200	mA
Switch ON-resistance				80	m $\Omega$
Output auto-discharge resistance			300		$\Omega$
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / $\mu\text{s}$
Switch current limit - time-out	Multiplier set to 1, $\text{WTFET6} = 00$	200		250	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 4, $\text{WTFET6} = 01$	800		1000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 8, $\text{WTFET6} = 10$	1600		2000	$\mu\text{s}$
Switch current limit - time-out	Multiplier set to 16, $\text{WTFET6} = 11$	3200		4000	$\mu\text{s}$
Leakage current into INFET6	FET6 disabled, $V_{FET6} = 0\text{ V}$		1		$\mu\text{A}$
<b>FET7</b>					
Overcurrent detect threshold	$T_A = 25^\circ\text{C}$	1000		1200	mA
Switch ON-resistance				80	m $\Omega$

## Electrical Characteristics - Load Switches (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Output auto-discharge resistance			300		Ω
Maximum output voltage slew rate after turnon		0.1	0.5	1	V / μs
Switch current limit - time-out	Multiplier set to 1, WTFET7 = 00	200		250	μs
Switch current limit - time-out	Multiplier set to 4, WTFET7 = 01	800		1000	μs
Switch current limit - time-out	Multiplier set to 8, WTFET7 = 10	1600		2000	μs
Switch current limit - time-out	Multiplier set to 16, WTFET7 = 11	3200		4000	μs
Leakage current into INFET7	FET7 disabled, V <sub>FET7</sub> = 0 V		1		μA

## 6.10 Electrical Characteristics - Control

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SYSTEM - CONTROL</b>					
VBATG, VACG, VSYSG, IRQ output low voltage	I <sub>VxxxGL</sub> = 1 mA		0.04	0.4	V
VBATG, VACG, VSYSG, IRQ output leakage current			0.01	0.4	μA
STAT output low voltage	I <sub>STAT</sub> = 1 mA		0.04	0.4	V
STAT output low voltage	I <sub>STAT</sub> = 5 mA			0.6	V
STAT output leakage current			0.01	0.1	μA
System undervoltage lockout threshold	V <sub>SYS</sub> voltage decreasing	5.5	5.6	5.7	V
System undervoltage lockout threshold hysteresis			300		mV
LDO undervoltage lockout threshold	V <sub>SYS</sub> voltage decreasing	4.4	4.6	4.7	V
LDO undervoltage lockout threshold hysteresis			300		mV
V <sub>IL</sub> SDA, SCL input low voltage				0.4	V
V <sub>IH</sub> SDA, SCL input high voltage		1.2			V
SDA, SCL input current	Clamped on GND or 3.3 V		0.01	0.3	μA
SDA output low voltage	I <sub>SDA</sub> = 5 mA		0.04	0.4	V
<b>AD - CONVERTER</b>					
ADC resolution			10		Bits
Differential linearity error			±1		LSB
Offset error			1	5	LSB
Offset error, voltage				12.7	mV
Gain error			±8		LSB
Sampling time			150		μs
Conversion time			20		μs
Wait time after enable	Time needed to stabilize the internal voltages			10	ms
Quiescent current, ADC enabled by I <sup>2</sup> C	includes current needed for I <sup>2</sup> C block		500		μA
<b>AD - CONVERTER - MEASUREMENT RANGES</b>					
Voltage on VAC		0		17	V
Battery voltage VBAT		0		17	V
Input current IAC	V <sub>ACP</sub> - V <sub>ACN</sub> is measured	0		33	mV
Battery charge current IBAT	V <sub>SRP</sub> - V <sub>SRN</sub> is measured	0		40	mV
DCDC1 output current IDCDC1		0		4	A
DCDC2 output current IDCDC2		0		4	A

## Electrical Characteristics - Control (continued)

over recommended free-air temperature range and over recommended input voltage range (typical at an ambient temperature range of 25°C) (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
DCDC3 output current IDCDC3		0		4	A
FET1 output current IFET1		0		1.1	A
FET2 output current IFET2		0		220	mA
FET3 output current IFET3		0		3.3	A
FET4 output current IFET4		0		1.1	A
FET5 output current IFET5		0		1.1	A
FET6 output current IFET6		0		1.1	A
FET7 output current IFET7		0		1.1	A
<b>AD - CONVERTER - SIGNAL CONDITIONING</b>					
Voltage sense error referenced to maximum value				2%	
Current sense error referenced to maximum value for IAC and IBAT				20%	
Current sense error referenced to maximum value for DC-DC converter currents	Measurements at VSYS > 7.2 V, low side switch duty cycle at DCDC1-3 > 30%			15%	
Current sense error referenced to maximum value for load switch currents				10%	

## 6.11 Timing Requirements - I<sup>2</sup>C Interface

over recommended free-air temperature range and over recommended input voltage range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
f <sub>(SCL)</sub>	SCL clock frequency	Standard-mode	100	kHz
		Fast-mode	400	kHz
		Fast-mode Plus	1000	kHz
		High-speed mode, C <sub>b</sub> – 100 pF maximum	3.4	MHz
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	1.7	MHz
t <sub>BUF</sub>	Bus free time between a STOP and START condition	Standard-mode	4.7	µs
		Fast-mode	1.3	µs
		Fast-mode Plus	0.5	µs
t <sub>HD; STA</sub>	Hold time (repeated) START condition	Standard-mode	4	µs
		Fast-mode	600	ns
		Fast-mode Plus	260	ns
		High-speed mode	160	ns
t <sub>LOW</sub>	LOW period of the SCL clock	Standard-mode	4.7	µs
		Fast-mode	1.3	µs
		Fast-mode Plus	0.5	µs
		High-speed mode, C <sub>b</sub> – 100 pF maximum	160	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	320	ns
t <sub>HIGH</sub>	HIGH period of the SCL clock	Standard-mode	4	µs
		Fast-mode	600	ns
		Fast-mode Plus	260	ns
		High-speed mode, C <sub>b</sub> – 100 pF maximum	60	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	120	ns

(1) All values referred to V<sub>IH</sub> min and V<sub>IH</sub> max levels.

(2) For bus line loads C<sub>b</sub> from 100 pF to 400 pF, the timing parameters must be linearly interpolated.

## Timing Requirements - I<sup>2</sup>C Interface (continued)

over recommended free-air temperature range and over recommended input voltage range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT	
t <sub>SU; STA</sub>	Setup time for a repeated START condition	Standard-mode	4.7	μs	
		Fast-mode	600	ns	
		Fast-mode Plus	260	ns	
		High-speed mode	160	ns	
t <sub>SU; DAT</sub>	Data setup time	Standard-mode	250	ns	
		Fast-mode	100	ns	
		Fast-mode Plus	50	ns	
		High-speed mode	10	ns	
t <sub>HD; DAT</sub>	Data hold time	Standard-mode	1	3450	ns
		Fast-mode	1	900	ns
		Fast-mode Plus	1		ns
		High-speed mode, C <sub>b</sub> – 100 pF maximum	1 <sup>(3)</sup>	70	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	1 <sup>(3)</sup>	150	ns
t <sub>rCL</sub>	Rise time of SCL signal	Standard-mode		1000	ns
		Fast-mode	20	300	ns
		Fast-mode Plus		120	ns
		High-speed mode, C <sub>b</sub> – 100 pF maximum	10	40	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	20	80	ns
t <sub>rCL1</sub>	Rise time of SCL signal after a repeated START condition and after an acknowledge bit	Standard-mode		1000	ns
		Fast-mode	20	300	ns
		Fast-mode Plus		120	ns
		High-speed mode, C <sub>B</sub> – 100 pF maximum	10	80	ns
		High-speed mode, C <sub>B</sub> – 400 pF maximum <sup>(2)</sup>	20	160	ns
t <sub>rCL</sub>	Fall time of SCL signal	Standard-mode		300	ns
		Fast-mode	20 × (V <sub>DD</sub> / 5.5 V)	300	ns
		Fast-mode Plus	20 × (V <sub>DD</sub> / 5.5 V)	120	ns
		High-speed mode, C <sub>b</sub> – 100 pF maximum	10	40	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	20	80	ns
t <sub>rDA</sub>	Rise time of SDA signal	Standard-mode		1000	ns
		Fast-mode	20	300	ns
		Fast-mode Plus		120	ns
		High-speed mode, C <sub>b</sub> – 100 pF maximum	10	80	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	20	160	ns
t <sub>rDA</sub>	Fall time of SDA signal	Standard-mode		300	ns
		Fast-mode	20 × (V <sub>DD</sub> / 5.5 V)	300	ns
		Fast-mode Plus	20 × (V <sub>DD</sub> / 5.5 V)	120	ns
		High-speed mode, C <sub>b</sub> – 100 pF maximum	10	80	ns
		High-speed mode, C <sub>b</sub> – 400 pF maximum <sup>(2)</sup>	20	160	ns
t <sub>SU; STO</sub>	Setup time for STOP condition	Standard-mode	4	μs	
		Fast-mode	600	ns	
		Fast-mode Plus	260	ns	
		High-speed mode	160	ns	
C <sub>b</sub>	Capacitive load for SDA and SCL		400	pF	

(3) A device must internally provide a data hold time to bridge the undefined part between V<sub>IH</sub> and V<sub>IL</sub> of the falling edge of the SCLH signal. An input circuit with a threshold as low as possible for the falling edge of the SCLH signal minimizes this hold time.

## 7 Detailed Description

### 7.1 Overview

The TPS65090A is a single-chip power management IC for portable applications consisting of a battery charger with power path management for a dual or triple Li-Ion or Li-Polymer cell battery pack, three step-down converters, two always-on LDOs, and seven load switches with independent inputs.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Always On LDOs

As soon as a valid voltage at VSYS is applied, the LDOs start operating and providing a regulated output voltage at each of them. If DCDC1 is started, the output of the DCDC1 converter will be connected to the output of LDO1 with an internal bypass switch to ensure seamless transition. Finally, LDO1 will stop operating. LDO1 will restart when the voltage at its output drops below its regulation voltage. In this case, both outputs will be disconnected from each other. There will be no current flowing backward from the LDO1 output to the DCDC1 output. The same function is implemented for DCDC2 and LDO2.

### 7.3.2 Power Path Control

The device automatically switches adapter or battery power to the system load. The battery is connected to the system by default during power up or if the adapter power is not available. As soon as a valid voltage is detected on VACS and the voltage at VAC is higher than the battery voltage, the battery is disconnected and the AC power path switches controlled through the pins ACG and ACS are turned on. The system is powered through the adapter input. If the voltage on VACS is higher than the overvoltage protection threshold the AC power path switches are turned off or not turned on to protect the system from damage. Any voltage on VACS lower than the input undervoltage lockout (UVLO) threshold voltage will cause the AC power path switches to be off.

To protect the device and the system against reverse voltage additional external components are required to protect the pins VAC, VACS ACG and ACS which would be exposed to the reverse voltage. See the EVM documentation [SLVU778](#) for more details.

In case the maximum adapter output current is not high enough to supply the complete system, the system can be powered through the adapter and the battery at the same time. If the adapter current is limited, the adapter voltage will drop to the battery voltage level and the backgate diode of the battery switch will conduct current.

To minimize the losses in this mode of operation, the battery switch is turned on. To detect whether there is still a power source connected at the AC input, the AC power path switches are turned off every 0.5 s for a few milliseconds. While the AC power path switches are off, VAC is discharged through a 1-k $\Omega$  resistor to GND. If the voltage at VACS did not drop below the input UVLO threshold voltage, the AC power path switches are turned on again to allow the power source connected to the AC input to supply the system again.

### 7.3.3 Supply Status Outputs

The status of the power supply is indicated through the status pins VACG, VBATG and VSYSG. All pins are open-drain outputs and need a pullup resistor to the respective logic supply voltage they are connected to.

VACG will be high if a voltage is detected at VAC and VACS which is in a useable window. This means the voltage detected at VACS must be lower than the overvoltage threshold and it must be higher than the input UVLO threshold voltage. Also, the voltage at VAC must be higher than battery voltage. If no battery is connected, the minimum voltage is above the UVLO threshold.

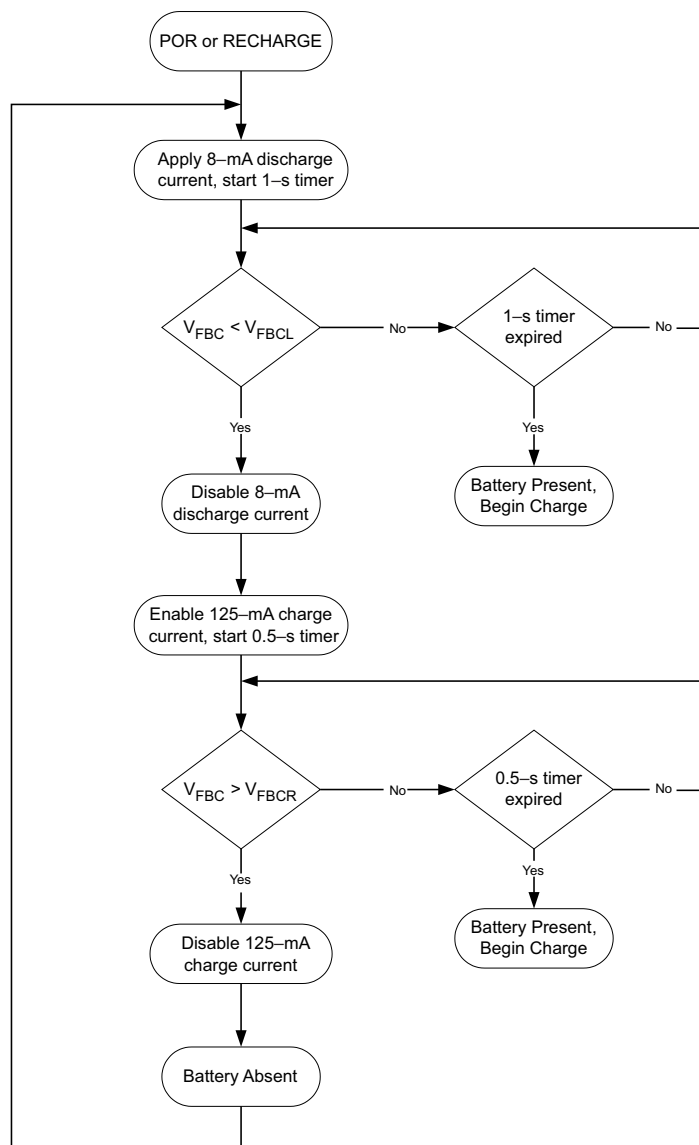

VSYSG will be high as soon as the system voltage, detected at VSYS\_L1 and VSYS\_L2, is above its undervoltage thresholds.

VBATG will be high if the voltage detected at FBC is between the minimum and the maximum voltage for battery good detection and the differential voltage  $V_{SRN} - V_{VBAT}$  is lower than 20 mV. This indicates that the battery discharge current is not exceeding the programmed maximum level.

### 7.3.4 Charger

Charging can be enabled by using the ENC pin or by programming the respective register through I<sup>2</sup>C. The charger will then start working when VACG is detected. If the battery is completely charged or charging has been terminated for any other reason, the charger will stay idle. Charging can be restarted by disabling the charger and enabling it again.

As soon as the charger is enabled it starts with battery detection as shown in [Figure 36](#). If no battery or a battery short is detected the charger will continue with battery detection. If the battery is detected it will start charging.

**Feature Description (continued)**

**Figure 36. Battery Detection**

The charger controls a low constant-charge current during a precharge phase when the battery is at a very low voltage and must be recovered. The charger controls a high fast-charge current if the battery voltage is greater than the low voltage threshold and less than the charge termination voltage. If the battery voltage has reached the charge termination voltage, the charger controls this voltage until the charge current has decayed below the charge termination threshold or the fast-charge safety timer has timed out. Precharge current and charge termination current are either 10% of the programmed fast-charge current if the fast-charge current is set to 1 A or higher. Otherwise they will be controlled to 100 mA. A complete charging cycle is shown in [Figure 37](#).

Feature Description (continued)

Figure 37. Charging Cycle

To support charging with weak power sources, the charger stays in operation even if it cannot control the charge current at the programmed level. For this operating condition, the charge termination based on low charge current can be turned off by programming the respective register.

The fast-charge safety timer is programmed to its lowest value by default. The time-out time can be increased by programming higher values in the respective registers. It cannot be turned off.

All charge currents are defined depending on the current sense resistor connected between the pins SRN and SRP. The maximum fast-charge current generates a 40 mV voltage drop across this resistor. All other currents are lower.

The charge termination voltage is defined by a resistive voltage divider connected between battery, feedback input of the charger (FBC), and GND. The maximum voltage at FBC which is controlled is typically 2.1 V.

The charger has also inputs to measure the battery cell temperature. It supports using two different temperature sensors which can be placed at different locations in the battery pack. For more details on the temperature sensing circuit, refer to [Application and Implementation](#). For biasing the temperature sense resistor networks and the internal comparator reference the voltage at the VREFT pin is used. It is turned off if the charger is disabled.

Charge current and charge termination voltage can be programmed to lower than the maximum values using the digital interface. They are also controlled and forced to lower values depending on the measured battery cell temperature. The respective values for the five different temperature regions can be programmed in the charge control registers (CG\_CTRLx) using the digital interface. Default settings for temperature thresholds and the respective fast-charge current and charge termination voltages are defined according to JEITA recommendations

## Feature Description (continued)

for multicell battery packs. The definitions for the thresholds and temperature zones are shown in [Figure 38](#). [Figure 38](#) also shows the default values for temperature thresholds, charge current and charge termination voltage, which are programmed in TPS65090A. The optional values which can be programmed through the digital interface, can be found in [Electrical Characteristics](#). The actual temperature zones the charger operates in, can be read out from the charge status register CG\_STATUS1.

**Figure 38. JEITA Charging Profile**

If the adapter current measured with a sense resistor between the pins ACN and ACP exceeds its programmed value or the adapter voltage measured at VACS drops below a certain level (typically 7 V, see [Electrical Characteristics](#)) the charge current is reduced automatically to avoid an overload condition of the AC adapter and an undervoltage condition for the system. The charge current is also reduced if the charger temperature measured in the IC is exceeding 100°C.

The charger indicates its current status of operation in two ways. One is the STAT output pin which can be used to drive an LED. The STAT pin can have three different states as described in [Table 1](#). To get details about the current state of charging the charging status register CG\_STATUS1 can be read.

**Table 1. Charger Status Pin STAT**

CHARGING STATE	STAT PIN STATE
Charging complete Sleep mode Charging disabled	HIGH
Charging in progress (including recharging)	LOW
Charging suspended No battery detected Safety timer fault (precharge, fast-charge)	Blinking with 0.5 Hz

A status change from charging suspended to charging active and back sets the interrupt CGACT and charging completed sets the interrupt CGCPL. Both interrupts can be masked. If not masked, they will trigger IRQ pin to go low when they are set.

### 7.3.5 DC-DC Converters

The built in DC-DC converters are completely integrated except the required passive components. To maintain high efficiency, they are implemented as synchronous step-down converters. At medium and heavy loads they are operating in a PWM mode. As soon as the inductor current gets discontinuous, which means that the output current gets lower than half of the inductor ripple current the converters enter Power Save Mode. In Power Save Mode the switching frequency decreases linearly with the load current maintaining high efficiency. The transition into and out of Power Save Mode happens within the entire regulation scheme and is seamless in both directions.

All DC-DC converters can be enabled using their ENx pins. If they should be enabled using the digital interface the enable pin function can be masked in the DCDCx\_CTRL register. If masked enable only works by writing a 1 to the EN bit in the DCDCx\_CTRL register.

As soon as the output voltage reaches 80% of the input voltage, the power good register bit for this converter is set to 1. If the output voltage drops below this threshold the power good bit is set back to 0.

The start-up of the converter is controlled by an internal soft-start to make sure the output voltage is built up smoothly and the inrush current during start-up is kept at minimum.

All converters are current limited. The current limit is controlling the maximum output current. If the current limit is controlling the converter its respective OLDCDCx interrupt bits are set to 1. The OLDCDCx interrupt bits can be masked. If not masked, they will trigger IRQ pin to go low when they are set.

To make sure that the output voltage of the DC-DC converters is decreasing fast to a safe low value a built in output auto-discharge function can be enabled using the ADENDCDC bit in the respective DCDCx\_CTRL register. If enabled, the output capacitors are actively discharged as soon as the converter is disabled. While the converter is enabled, its output discharge circuit is off to save power.

### 7.3.6 Load Switches

Load switches are turned on using the digital control interface by writing 1 in the ENFETx bit of their load switch control register FETx\_CTRL. They cannot be enabled before DCDC1 and DCDC2 have been started and their output voltage is above their power good level. If DCDC1 or DCDC2 will be disabled, load switches will be immediately disabled as well and enabled if both DC-DC converters are enabled again.

After being turned on, the output voltage of the load switch is ramped up with a controlled slope ( $<1 \text{ V} / \mu\text{s}$ ). The current limit is active during that time and does not allow the current to overshoot. This means the slope can be slower if controlled by the current limit.

After being turned on, a timer is started. If the timer terminates, the output voltage must have reached the input voltage. Otherwise, the load switch is turned off again expecting an overload condition. The minimum value of the timer is 200  $\mu\text{s}$ . This timer is used as well if the load switch control limits the current. The timer can be extended through the digital control interface using 4 steps (max factor 16 up to 3 ms). If the load switch has been turned off by this safety timer, the load switch can only be turned on again by reprogramming its ENFETx bit to 1 again.

As soon as the output voltage reaches 80% of the input voltage, the power good register bit for this load switch is set to 1. If the output voltage drops below this threshold, the power good bit is set back to 0.

All load switches are current limited. The current limit is regulating the maximum output current. A temperature sensor can trigger the turnoff of the load switch as well. If the current limit is controlling the switch, their respective OLFETx interrupt bits are set to 1. The OLFETx interrupt bits can be masked. If not masked, they will trigger IRQ pin to go low when they are set.

To make sure that a voltage on the output of FET2 is not supplying its input while turned off, it is reverse-current protected. This feature is only available at FET2 to support controlling circuit blocks which can get power from an external source while the system is turned off, like HDMI.

To make sure that the output voltage of the load switches is decreasing fast to a safe low value, a built-in output auto-discharge function can be enabled using the ADENFETx bit in the respective FETx\_CTRL register. If enabled, the output capacitors are actively discharged as soon as the load switch is disabled. While the load switch is enabled, its output discharge circuit is off to save power.

### 7.3.7 ADC

Analog-to-digital conversion is controlled according to the flow chart shown in Figure 39. After enabling the ADC, the channel which should be measured must be defined in the ADC control register. Analog-to-digital conversion is started by writing the start command in the ADC register. As soon as conversion is finished, ADEOC is set to 1 and the data is available in the ADOUT registers.

**Figure 39. Analog-to-Digital Conversion**

### 7.3.8 Protection

The device has 2 built-in undervoltage detectors. If the system voltage is not high enough to safely operate the DC-DC converters, they are shut down with the higher undervoltage threshold which also sets VSYSG high as soon as the system voltage has increased above this threshold. In this condition, the LDOs are still on to supply the internal control circuitry. If the system voltage further decreases and hits the second lower undervoltage threshold, the LDOs are turned off as well and the internal control circuit is disabled. The control circuit is reset and restarted if the supply voltage increases above the lower undervoltage threshold.

The device has a built-in temperature sensor which monitors the internal IC temperature. If the temperature exceeds the programmed threshold (see [Electrical Characteristics](#)), the device stops operating. As soon as the IC temperature has decreased below the programmed threshold, it starts operating again. There is a built-in hysteresis to avoid unstable operation at IC temperatures at the overtemperature threshold.

### 7.3.9 Interrupts

The device monitors several internal states of power path, charger, DC-DC converters, and load switches. If any of those states changes, an interrupt can be asserted. By default, all states are masked, so any state which should generate an interrupt must be unmasked. If an unmasked state changes, it will generate an interrupt, which means the output impedance of the IRQ pin will go low, and if properly connected, the voltage will go low. What has caused the interrupt can be read out from the interrupt status registers IRQ1 and IRQ2. The interrupt will be cleared by writing a zero to the IRQ bit in the interrupt status register IRQ1. The content of the status registers are refreshed only after an interrupt has occurred.

## 7.4 Device Functional Modes

The TPS65090A is designed with two LDOs that have a fixed voltage and are 'always on'. It is also designed with two fixed-voltage converters. Using external feedback resistors, a third DC-DC converter can be programmed to any voltage within the range of 1 V to 5 V. The devices also has seven load switches (one system voltage switch, one 5-V switch, and five 3.3-V switches) that can be connected as needed by the end application.

## 7.5 Programming

### 7.5.1 I<sup>2</sup>C Interface

I<sup>2</sup>C is a 2-wire serial interface developed by NXP (formerly Philips Semiconductor) (see I<sup>2</sup>C-Bus Specification and user manual, Rev 4, 13 February 2012). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I<sup>2</sup>C compatible devices connect to the I<sup>2</sup>C bus through open-drain I/O pins, SDA and SCL. A master device, usually a microcontroller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device.

TPS6509x works as a slave and supports the following data transfer modes, as defined in the I<sup>2</sup>C-Bus Specification: standard mode (100 kbps), fast-mode (400 kbps), and high-speed mode (up to 3.4 Mbps in write mode). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents are loaded when voltage is applied to TPS6509x higher than the UVLO threshold. The I<sup>2</sup>C interface is running from an internal oscillator that is automatically enabled when there is an access to the interface.

The data transfer protocol for standard and fast modes is exactly the same, therefore, they are referred to as F/S-mode in this document. The protocol for high-speed mode is different from the F/S-mode, and it is referred to as H/S-mode.

The TPS6509x supports 7-bit addressing; 10-bit addressing and general call address are not supported. The default device address is set to *1001000*. The 2 LSB bits of the address are factory programmable. Contact TI about availability of different default device addresses.

All registers are set to their default value when the supply voltage is below the UVLO threshold.

#### 7.5.1.1 F/S-Mode Protocol

The master initiates data transfer by generating a START condition. The START condition is when a high-to-low transition occurs on the SDA line while SCL is high, see [Figure 40](#). All I<sup>2</sup>C-compatible devices should recognize a START condition.

## Programming (continued)

The master then generates the SCL pulses, and transmits the 7-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse, see Figure 41. All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an *acknowledge*, see Figure 42, by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the master knows that the communication link with a slave has been established.

The master generates further SCL cycles to either transmit data to the slave (R/W bit = 0) or receive data from the slave (R/W bit = 1). In either case, the receiver must acknowledge the data sent by the transmitter. An acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary.

To signal the end of the data transfer, the master generates a STOP condition by pulling the SDA line from low to high while the SCL line is high, see Figure 40. This releases the bus and stops the communication link with the addressed slave. All I<sup>2</sup>C compatible devices must recognize the STOP condition. Upon the receipt of a STOP condition, all devices know that the bus is released, and they wait for a START condition followed by a matching address.

Attempting to read data from register addresses not listed in this section results in FFh being read out.

### 7.5.1.2 H/S-Mode Protocol

When the bus is idle, both SDA and SCL lines are pulled high by the pullup devices.

The master generates a start condition followed by a valid serial byte containing HS master code 00001XXX. This transmission is made in F/S-mode at no more than 400 Kbps. No device is allowed to acknowledge the HS master code, but all devices must recognize it and switch their internal setting to support 3.4-Mbps operation.

The master then generates a repeated START condition (a repeated START condition has the same timing as the START condition). After this repeated START condition, the protocol is the same as F/S-mode, except that transmission speeds up to 3.4 Mbps are allowed. A STOP condition ends the HS-mode and switches all the internal settings of the slave devices to support the F/S-mode. Instead of using a STOP condition, repeated START conditions are used to secure the bus in HS-mode.

Trying to read data from register addresses not listed in this section results in FFh being read out.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS65090A front-end PMU integrated circuit is intended for systems powered by a 2- or 3-cell Li-Ion or Li-Polymer battery with a typical voltage from 6 V to 17 V. Additionally, any other voltage source with a typical output voltage from 6 V to 7 V can power systems where the TPS65090A is used.

### 8.2 Typical Applications

#### 8.2.1 Front-End PMU Application

Figure 46. Front-End PMU Application Diagram

#### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 28 as the input parameters.

Table 28. Design Parameters

PARAMETER	EXAMPLE VALUE
Input voltage range (VAC)	6 V to 17 V
VLDO1	5 V (on by default)
VLDO2	3.3 V (on by default)
DCDC1	5 V (off by default)
DCDC2	3.3 V (off by default)
DCDC3	3.3 V (off by default)

### 8.2.1.2 Detailed Design Procedure

#### 8.2.1.2.1 Programming the Converter or Charger Output Voltage

Within the TPS65090A device, there are fixed and adjustable outputs. In the case where the voltage is adjustable, an external resistor divider is used to set the output voltage. The resistor divider must be connected between the output, the feedback pin and GND. When the output voltage is regulated properly, the voltage at the feedback pin will be in the range as defined in [Electrical Characteristics](#), that is, 800 mV for DCDC3 and 2.1 V for the charger. The feedback pin typically has 0.1  $\mu\text{A}$  of leakage; to meet this current requirement and maintain the feedback voltage, TI recommends setting the feedback divider current by at least a factor of ten to one-hundred times that of the pin leakage. Using the feedback voltage of 2.1 V and 10  $\mu\text{A}$  ( $100 \times 0.1 \mu\text{A}$ ), the resistor between the feedback pin and GND can be calculated to be less than 210 k $\Omega$ . This value for the resistor will provide sufficient current through the resistor divider at the typical feedback voltage. Selecting resistor values is a trade off between noise immunity and light load efficiency. The lower the resistor value, the higher the noise immunity; however, the more current through the resistor, the less efficient the converter is at light loads. Consider R1 is connected from the output of the inductor to the feedback pin and R2 from the feedback pin to ground. From the recommendations for R2, less than 210 k $\Omega$ , the value of the resistor connected between the output and feedback, R1, depending on the desired output voltage  $V_{\text{OUT}}$ , can be calculated using [Equation 1](#).

$$R1 = R2 \cdot \left( \frac{V_{\text{OUT}}}{V_{\text{FB}}} - 1 \right) \quad (1)$$

[Table 29](#) contains recommended values for the feedback divider for the most common output voltages.

**Table 29. Feedback Resistor Values for Common Converter Output Voltages**

OUTPUT VOLTAGE	1.2 V	1.35 V	1.8 V	3.3 V
R1 [k $\Omega$ ]	260	330	510	750
R2 [k $\Omega$ ]	510	470	400	240

**Table 30. Feedback Resistor Values for Common Charger Output Voltages**

OUTPUT VOLTAGE	8.4 V	12.6 V
R1 [k $\Omega$ ]	330	1100
R2 [k $\Omega$ ]	110	220

#### 8.2.1.2.2 Programming Input DPM Current and Charge Current

Maximum input DPM current and charge current are defined by the values of the sense resistors used. The sense resistor value  $R_S$  can be calculated using [Equation 2](#).

$$R_S = \frac{V_S}{I_S} \quad (2)$$

$V_S$  is the differential voltage at the sense input pins. For input current DPM, it is the differential voltage between ACP and ACN, and for charge current regulation, between SRP and SRN. For the differential voltage, TI recommends a maximum value of 40 mV here. More details can be found in [Electrical Characteristics - Power Path Control](#).

$I_S$  is the maximum current which must be controlled. For input current DPM, it is the maximum input current where charging is still allowed, and for charge current regulation, it is the maximum charge current.

#### 8.2.1.2.3 Output Filter Design (Inductor and Output Capacitor)

The external components must fulfill the needs of the application, but also the stability criteria of the devices control loop. The is optimized to work within a range of L and C combinations. The LC output filter inductance and capacitance must be considered together, creating a double pole, responsible for the corner frequency of the converter.

#### 8.2.1.2.4 Inductor Selection

At the L pins of the DC-DC converters and the charger, connecting an inductor is required.

At the DC-DC converters, TI recommends using a 2.2- $\mu\text{H}$  inductor with an appropriate current rating for the application. The derated inductance at high currents should not drop lower than 1  $\mu\text{H}$ .

At the charger, TI recommends using a 2.2- $\mu\text{H}$  inductor for fast-charge currents of 3 A and above. For lower fast charge currents, 3.3  $\mu\text{H}$  can be used. The current rating of the inductor must be suitable for the maximum fast-charge current required in the application.

The inductor value affects its peak-to-peak ripple current, the PWM-to-PSM transition point, the output voltage ripple, and the efficiency. The selected inductor must be rated for its DC resistance and saturation current. The inductor ripple current decreases with higher inductance and increases with higher  $V_{\text{IN}}$  or  $V_{\text{OUT}}$ .

To properly configure the converter, an inductor must be connected between pin L the output capacitors. To estimate the inductance value, Equation 3 can be used.

$$L = (V_{\text{IN}} - V_{\text{OUT}}) \times 0.5 \times \frac{\mu\text{S}}{\text{A}} \quad (3)$$

In Equation 3, the minimum inductance value,  $L$ , is calculated.  $V_{\text{IN}}$  is the minimum input voltage. As an example, a suitable inductor for generating 1.35 V from a two-cell Li-Ion battery is 2.2  $\mu\text{H}$ .

With the chosen inductance value, the peak current for the inductor in steady state operation can be calculated. Equation 4 shows how to calculate the peak current  $I_{\text{MAX}}$  in step-down mode operation.

$$I_{\text{MAX}} = \frac{I_{\text{OUT}}}{0.8} + \frac{V_{\text{OUT}} \times (V_{\text{IN}} - V_{\text{OUT}})}{2 \times V_{\text{IN}} \times f \times L} \quad (4)$$

In the equation,  $f$  is the minimum switching frequency, which typically is in the range of 1 MHz.  $V_{\text{IN}}$  is the minimum input voltage. The critical current value for selecting the right inductor is the value of  $I_{\text{MAX}}$ . Consideration must be given to the load transients and error conditions that can cause higher inductor currents. This must be taken into consideration when selecting an appropriate inductor.

In DC-DC converter applications, the efficiency is essentially affected by the inductor AC resistance (that is, quality factor) and by the inductor DCR value. To achieve high-efficiency operation, care must be taken in selecting inductors featuring a quality factor greater than 25 at the switching frequency. Increasing the inductor value produces lower RMS currents, but degrades transient response. For a given physical inductor size, increased inductance usually results in an inductor with lower saturation current.

The following inductor types from different suppliers have been used with TPS65090 converters:

**Table 31. List of Inductors**

VENDOR	INDUCTOR SERIES
Coilcraft	XAL4020-222, XAL5030-222
Cyntec	PILE061E-2R2MS-11
Toko	FDV0530-2R2M
Würth Elektronik	WE 74437324022

### 8.2.1.2.5 Capacitor Selection

#### 8.2.1.2.5.1 Input Capacitor

Because of the nature of the switching converter and charger with a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. For most applications, TI recommends a ceramic capacitor of at least 10- $\mu\text{F}$ . The voltage rating and DC bias characteristic of ceramic capacitors must be considered. The input capacitor can be increased without any limit for better input voltage filtering. TI recommends a ceramic capacitor placed as close as possible to the respective VSYS and PGND pins of the IC.

#### 8.2.1.2.5.2 DC-DC Converter and Charger Bootstrap Capacitors

To make sure that the internal high side gate drivers are supplied with a stable low noise supply voltage, a capacitor must be connected between the CBx pins and the respective Lx pins.

TI recommends using a ceramic capacitor with a value of 4700 pF. The value of this capacitor should not be lower than 2200 pF or higher than 0.01  $\mu\text{F}$ . For testing, a 4700-pF, size 0402, 6.3-V capacitor was used.

### 8.2.1.2.5.3 DC-DC Converter and Charger Output Capacitors

TI recommends ceramic capacitors with low ESR values that provide the lowest output voltage ripple. The output capacitor requires either an X7R or X5R dielectric. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance overtemperature, become resistive at high frequencies.

At light load currents, the converter operates in power save mode and the output voltage ripple is dependent on the output capacitor value and the PFM peak inductor current. Higher output capacitor values minimize the voltage ripple in PFM Mode and tighten DC output accuracy in PFM Mode. To achieve specified regulation performance and low output voltage ripple, the DC-bias characteristic of ceramic capacitors must be considered. The effective capacitance of ceramic capacitors drops with increasing DC - bias voltage.

For the output capacitors of the DC-DC converters and the charger, TI recommends the use of small ceramic capacitors placed as close as possible to the output pins and the respective PGND pins of the IC. If, for any reason, the application requires the use of large capacitors which cannot be placed close to the IC, use a smaller ceramic capacitor in parallel to the large capacitor. The small capacitor should be placed as close as possible to the output pins and the respective PGND pins of the IC.

At the DC-DC converters, TI recommends the capacitance close to the IC to be close to 22  $\mu\text{F}$ . It should not be lower than 10  $\mu\text{F}$  or higher than 47  $\mu\text{F}$ .

At the charger, TI recommends a 22- $\mu\text{F}$  capacitance.

To get an estimate of the recommended minimum output capacitance, [Equation 5](#) can be used.

$$C_{\text{OUT}} \geq \frac{22 \cdot \mu\text{F} \cdot \mu\text{H}}{L} \quad (5)$$

A capacitor with a value in the range of or higher than the calculated minimum should be used. This is required to maintain control loop stability.

### 8.2.1.2.5.4 LDO Output Capacitors

To achieve stable and accurate output voltage regulation of the LDO's, a small ceramic capacitor is required at their outputs. TI recommends using at least 2.2  $\mu\text{F}$ .

### 8.2.1.2.5.5 Load Switches Output Capacitors

The maximum expected output capacitance at the load switches is 47  $\mu\text{F}$ . Any lower value can be used.

### 8.2.1.2.6 Charger Battery Temperature Sensing

To measure the battery cell temperature, resistors with temperature dependent resistance (NTC) must be placed close to the cells which must be measured. The device supports using two independent measuring points with its TS1 and TS2 input pins. The temperature sense resistor and the linearizing resistor network must be the same. If only one temperature sense resistor is used, the sense resistor network must be connected to TS1 and TS2.

As a default, the internal circuit is optimized to work with a 10-k $\Omega$  NTC resistor with a temperature characteristic described with a B value in the range of 3450 with one resistor in parallel and one resistor in series for linearization and to define the resistor-divider connected to VREFT, TSx and AGND. A possible default example would be NTCS0805E3103FLT from Vishay in parallel with a 6.8-k $\Omega$  resistor and a 2.2-k $\Omega$  resistor in series.

### 8.2.1.2.7 Reverse Voltage Protection

To protect the design against reverse voltage at the AC adapter input, additional external components are required. The pins VAC, VACS and the input path switches are exposed to the negative voltage and need some protection.

To protect the VAC pin, TI recommends using a small signal diode between the adapter input and the VAC pin.

Protecting VACS can be done either by connecting this pin to the protected VAC with the tradeoff of losing accuracy or connecting VACS to the adapter input with a 10-k $\Omega$  resistor.

To make sure that the AC switches are not turned on with the reverse voltage at the AC adapter input, a small signal N-channel FET can be used to short the voltage at ACG to ACS. The source of this FET must be connected to ACS, the drain to ACG. The gate must be connected to the AC adapter input GND either direct, or if the maximum gate voltage rating does not match the maximum input voltage, with a resistor-divider between AC adapter input GND and ACS. An example for the small signal FET would be BSS138W-7-F. To protect the ACS and the ACG pin resistors with values in the range of 4.7 kΩ or higher between the pins and the gate and source pins of the AC FET's must be used.

An example for this additional reverse protection circuit can be found in the *TPS65090EVM User's Guide*, [SLVU778](#).

### 8.2.1.2.8 AC Switches

The AC adapter protection switches are recommended as CSD17304Q3: MOSFET, NChan, 30 V, 56 A, 9.8 mΩ.

### 8.2.1.2.9 Battery Switches

The battery switches are recommended as CSD25401Q3: MOSFET, PChan, -20 V, 60 A, 8.7 mΩ.

## 9 Power Supply Recommendations

The TPS65090A device integrates a power path management system that automatically switches power to the load from either an AC adapter or from battery power. The voltage range for the AC adapter should fall within the 6 V to 17 V range. Battery power can be provided by either a dual or triple Li-Ion or Li-Polymer cell battery pack. On power up, the battery pack is connected to the load by default. However, if a valid voltage is detected on the VACS pin and the voltage on the VAC pin is higher than the battery voltage, the battery is disconnected and the AC adapter is connected to the load through the external power path switches.

## 10 Layout

### 10.1 Layout Guidelines

For all switching power supplies, the layout is an important step in the design, especially at high peak currents and high switching frequencies. If the layout is not carefully done, the regulator could show stability problems as well as EMI problems. Therefore, use wide and short traces for the main current path and for the power ground tracks. The input capacitor, output capacitor, and the inductor should be placed as close as possible to the IC. Use a common ground node for power ground and a different one for control ground to minimize the effects of ground noise. Connect these ground nodes at any place close to one of the ground pins of the IC.

The feedback divider should be placed as close as possible to the control ground pin of the IC. To lay out the control ground, TI recommends short traces, as well as separation from the power ground traces. This avoids ground shift problems, which can occur due to superimposition of power ground current and control ground current.

A complete layout example can be found in the *TPS65090EVM User's Guide* ([SLVU778](#)).

## 10.2 Layout Example

Figure 71. DCDC1 Layout Example

### 10.3 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are listed below.

- Improving the power dissipation capability of the PCB design.
- Improving the thermal coupling of the component to the PCB by soldering the PowerPAD.
- Introducing airflow in the system.

For more details on how to use the thermal parameters in the dissipation ratings table, see the *Thermal Characteristics Application Note* ([SZZA017](#)) and the *IC Package Thermal Metrics Application Note* ([SPRA953](#)).

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

### 11.2 Documentation Support

#### 11.2.1 Related Documentation

For related documentation, see the following:

All other trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65090ARVNR	ACTIVE	VQFN-MR	RVN	100	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS65090A	<a href="#">Samples</a>
TPS65090ARVNT	ACTIVE	VQFN-MR	RVN	100	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS65090A	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Quad Flatpack, No-leads (QFN) staggered multi-row package configuration.
  - Pin A1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin A1 identifiers are either a molded, marked, or metal feature.
  - E. The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - F. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
